hanankareem05@gmail.com

Address

Door no: 2/31, Muslim

street, Avanam,

Thanjavur – 614623.

Phone number 9655365033

Date of Birth 05.09.1996

CAREER OBJECTIVE

To leave an everlasting impression in the field of biotechnology, by implementing expertise in designing innovative projects, with better, faster and accurate techniques in my field; thereby increasing the reputation of your esteemed organisation. To work in a challenging and dynamic environment and to keep adding values to the organization that I respect and concurrently upgrading my skills and knowledge.

TECHNICAL SKILLS

Flow cytometry, Sanger Sequencing, Microarray, Capillary Electrophoresis, SDS-PAGE, PCR, Western blotting, DNA isolation, RNA isolation, Northern blotting, Southern blotting, Hybridization, Recombinant DNA technology, Agarose gel electrophoresis, DIGE, Antibiotic assay, Biochemical assay, Bacterial transformation, Molecular biology, Cell biology, Genetic engineering and Animal tissue culture lab techniques, Trphan blue assay, MTT assay, Algal culture techniques, HPLC, Gas chromatography, SEM and STEM.

SKILLS

- ✓ Good communication - written and oral skills
- ✓ Effective interpersonal skills
- ✓ Excellent conceptual and analytical skills

PERSONALITY

- ✓ Communicative
- ✓ Punctuality
- ✓ Creativity
- ✓ Goal oriented
- ✓ Team player
- ✓ Self-motivated
- ✓ Autodidact

Reference

Dr. Muthusivaramapandiyan

Assistant Professor

Department of Biengineering

National Institute of Technology-Agartala

E-mail id: msrpm.nita@gmail.com

EDUCATION

Master degree

National Institute of technology-Agartala

Agartala, Tripura, India

M.Tech Biotechnology and Biochemical engineering

CGPA: 9.1/10

Year of Joining: 2020

Year of Graduation: 2022

Bachelor degree

Anna University - BIT Campus,

Anna University, Tiruchirappalli, Tamil Nadu, India

B.Tech Biotechnology

Achieved Class: First class

Class Rank: 5

Year of Joining: 2014

Year of Graduation: 2018

SOFTWARE SKILLS

- ✓ Word
- ✓ Excel
- ✓ Photoshop
- ✓ Tally
- ✓ Molecular docking
- ✓ Proteomic tools
- ✓ Microsoft Powerpoint
- ✓ Insilico Prediction Tools for Mutation
- ✓ DNASTAR
- ✓ Python

LANGUAGE KNOWN

- ✓ English
- ✓ Tamil
- ✓ Hindi
- ✓ Arabic

PUBLICATION

Exploration of beneficial activities of marine algae for cosmeceuticals

A.Hanan*, P.Gowsalya, V.Tamil Elakkiya, Dr.K.Ravi Shankar

DECLARATION

I hereby declare that the above mentioned details are true to the best of my knowledge and belief

RESEARCH EXPERIENCE

04.2016 - 08.2016

Anna University - BIT Campus, Anna University, Tiruchirappalli, Tamil Nadu, India.

Student

1. Two Mini project in Algal Biotechnology

I have completed two mini projects in algae, among which one have been published in the journal of SRUA. Practical laboratory experience and knowledge of the range of techniques in algal biotechnology and microbiology has been gained via the same. The aim of the project was the usage of *Gracilaria verrucosa* algae as an alternative source for nutritious fruits and vegetables in cosmetic industries. Because highly nutritious fruits and vegetables are exploited for the antioxidant and antiinflammatory properties in the production of body lotions, creams and soaps. A set of five species of algae was collected and compared for antioxidant property at varying concentration and different methods. *Gracilaria verrucosa* have showed the highest antioxidant property at varying concentration with maximum inhibition of 96.67% at 50mg/ml. The cell viability was also used to check the toxicity studies and found to have the cell viability of 61.96% at 1mg/ml. So, as a result, *Gracilaria verrucosa* was recommended for usage in cosmetic industry as a replacement of nutritious fruits and vegetables.

2. Dissertation Project

I have completed my dissertation project "SACS gene mutation in Recessive and Early cases of Ataxia within India. In my Dissertation project protocol for genetic screening for SACS gene was standardized by using PCR and Sanger Sequencing. The patient samples were checked for already reported HGMD mutations. Around 16 sites were screened for single insertion mutations, 98 sites for missense mutation, 43 sites for small deletions and 9 sites for gross deletions. Some novel SNPs were observed in the patients suspected for ARSACS. As all the SNPs were intronic in origin, it may alter the splice sites and hence can modify the translational synthesis. Out of 38 patient samples, single novel frameshift mutation was identified in two patient samples and five novel single nucleotide polymorphisms were identified which are not reported in HGMD. Through this work, we found that the frequency of autosomal recessive cases of ataxia in India due to mutation in the saccin gene is around 5%

3. One Mini project in Plant Biotechnology

I have completed one mini project in plant biotechnology (Copper nanoparticles as a pesticide which enhances the plant growth and not affect plant defense mechanism). The aim of this project is to avoid the microbial contamination in plants. Brassica nigra is used as a model plant to test the copper nanoparticles as pesticides. It avoids microbial contamination and does not interfere the plant defense mechanism. It enhances the plant growth, shoot and root length. Chemicals are used as a pesticide which affects plant defense mechanism and soil fertility. Copper nanoparticles are the most efficient pesticide compare to copper sulfate. Practical laboratory experience and knowledge of the range of techniques in plant biotechnology and synthesis of nanoparticles.

QSAR model for finding the potential inhibitors of Alzheimer disease is developed by using classification methods. A database contains 47000 molecules collected from various sources which have been accumulated for building the QSAR model. This dataset contains different compounds along with various scaffolds and physiochemical properties, consists of diverse chemical properties in the inhibitor activity and drug property. The unique characteristic feature of the applied QSAR strategy is the amalgamation of hybridization with backward elimination of models, resulting to improve the quality of the final QSAR model. Moreover, the visual analysis of the molecular descriptors gives assurance to the absence of information redundancy in the model. The molecular docking was achieved to investigate the binding mode of the inhibitor compounds, defines the best or worst inhibitor. The proposed QSAR model has low cardinality, and classified the high percentage of inhibitor compounds which based on IC50 value. In future, we create a website for Alzheimer disease inhibitors.
